

Digitalization in Marine Hydrodynamics

– Focusing on Introduction to KRISO Activities

Booki, Kim

Korea Research Institute Ships & Ocean engineering

CONTENTS

Ship Hydrodynamics

Virtual Towing Tank

Big Data : Full scale performance

DB & ML : Power prediction & Hull form design improvement

WEB-based Design Platform : Hull, Propeller & ESD

DB & ML : Cavitation & Noise

AI & Big Data : ICE

Ocean Engineering

Virtual Ocean Engineering Basin based on High Fidelity CFD Simulation

Digital Twin for Model Tests

Ocean Renewable Energy

Simulation-based Design of Ocean Renewable Energy

Digital Twin for OWC Wave Energy Converter

CFD / FEA can be an alternative approach for design validation?

Virtual Towing Tank

KRISO in-house Code WAVIS

Resistance/Propulsion

Propeller Open Water test

Hull form design evaluation

Added Resistance in waves

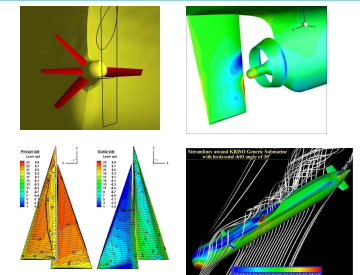

Maneuvering

Seakeeping

Misc.

Big DATA : Full scale performance

Operational Seas

Real time performance monitoring

- ✓ Data collected onboard is aggregated and sent to onshore monitoring centre.
- ✓ Data is used for analytics such as current performance, trends and custom KPI

Full scale performance verification

- ✓ Performance of a ship during operation can be obtained by correcting environmental force from measured data
- ✓ Predicted performance from model test or sea trial can be verified with operating performance

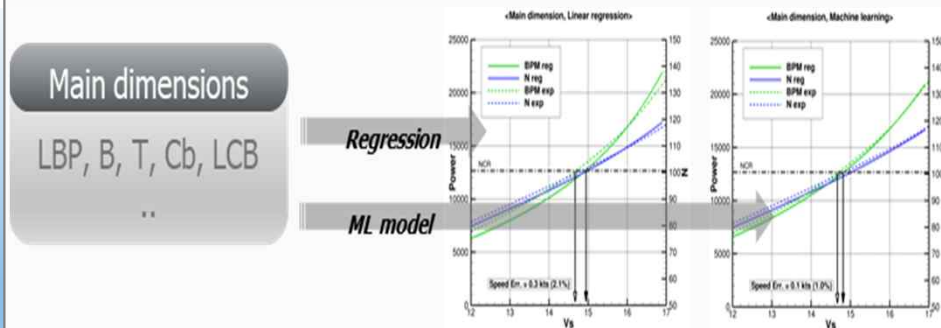

Optimal Maintenance scheduling

- ✓ Performance of a ship during operation degrades over the time due to aging such as hull fouling.
- ✓ Optimal maintenance such as hull cleaning and propeller polishing can be scheduled based on performance degradation trends and expected gain from maintenance.

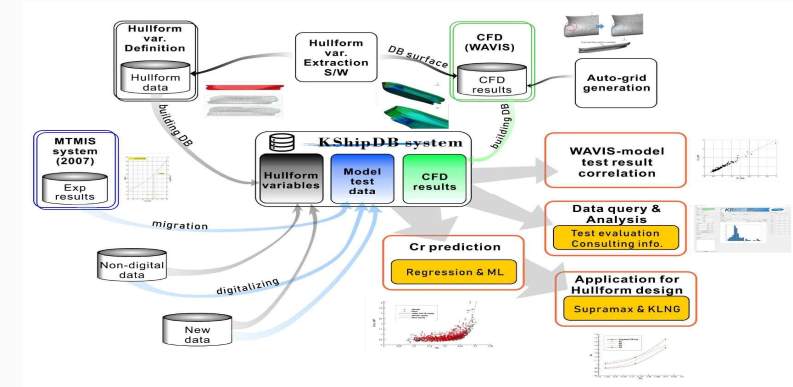

Database and Machine Learning : Hull form design and improvement

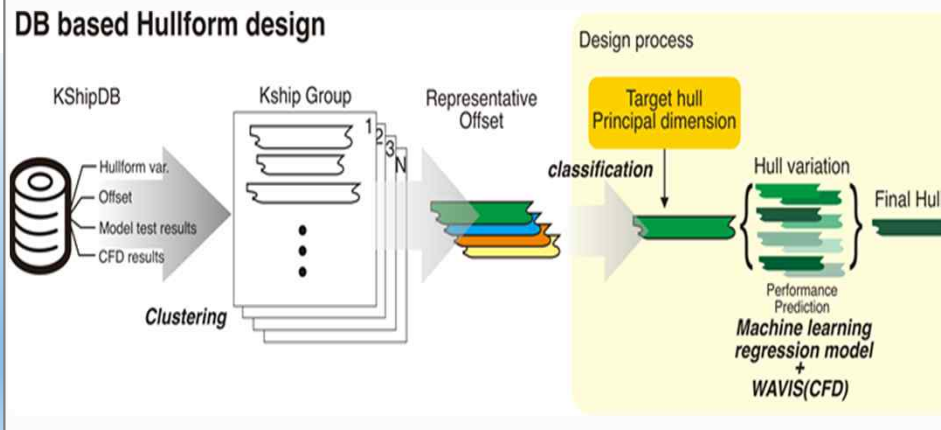

Speed-power prediction based on DB

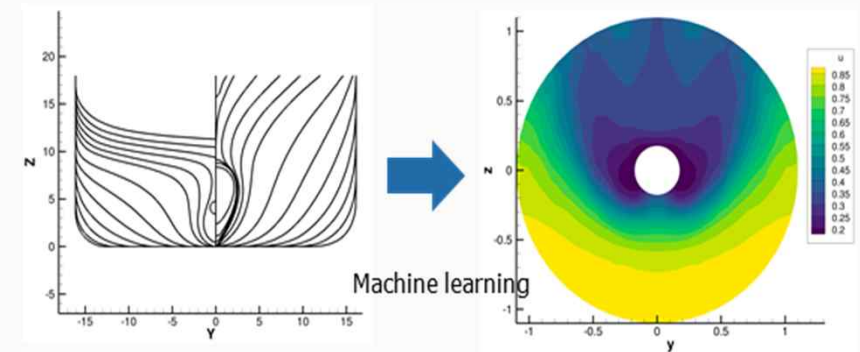

KRISO database system (KshipDB)

DB-based hull form design

Offset-based ML for local flow prediction

WEB-based Design Platform: Hull, Propeller and ESD

→ Frame of Platform

Database for Hydrodynamic Design

- Design Particulars
- Geometry
- CFD Results
- Model Tests Results

Standardization of Geometry Variation

- Hull form
- Propeller
- ESD
- Rudder

Standardization of CFD Analysis

- Resistance
- Self-Propulsion
- P.O.W
- Added Resistance

Optimization Scheme

- Bulbous Bow
- Stern Profile
- Propeller Geometry
- ESD Geometry

WEB based UX for Easy Access

- Server & Client
- Parallel Machine
- Commercial & In-house Codes

RANS with Parallel Machine

→ Implemented Functions

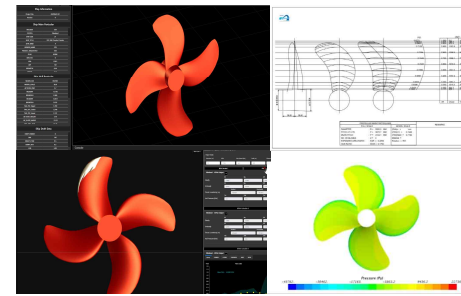

Geometry Variation

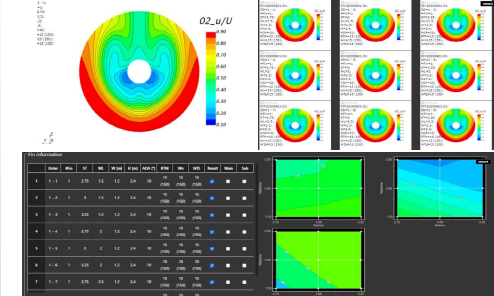

Hull form Optimization

Propeller Optimization

ESD Optimization

Database and Machine Learning : Cavitation & Noise

Monitoring and control of cavitation and noise

Quantification of cavitation amount using image processing

URN monitoring using on-board noise and vibration data

Conceptual diagram of K-V.G.

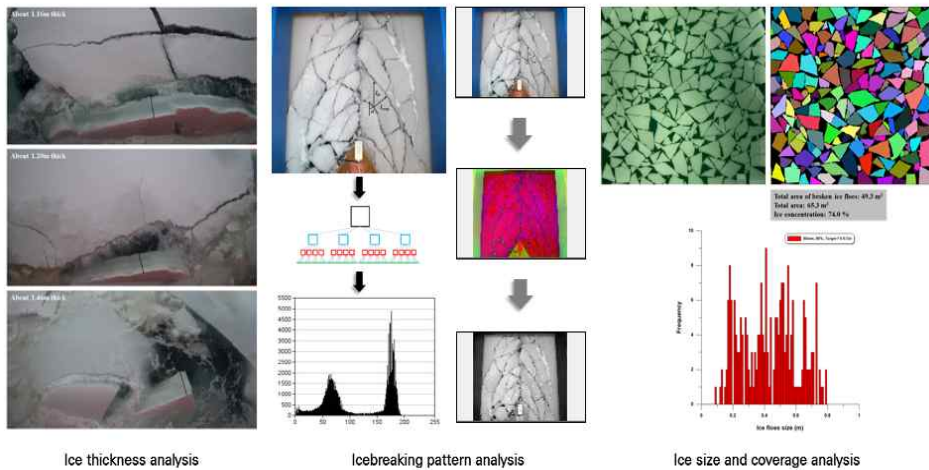

K-V.G. design software

Digitalization of cavitation and noise using ICT

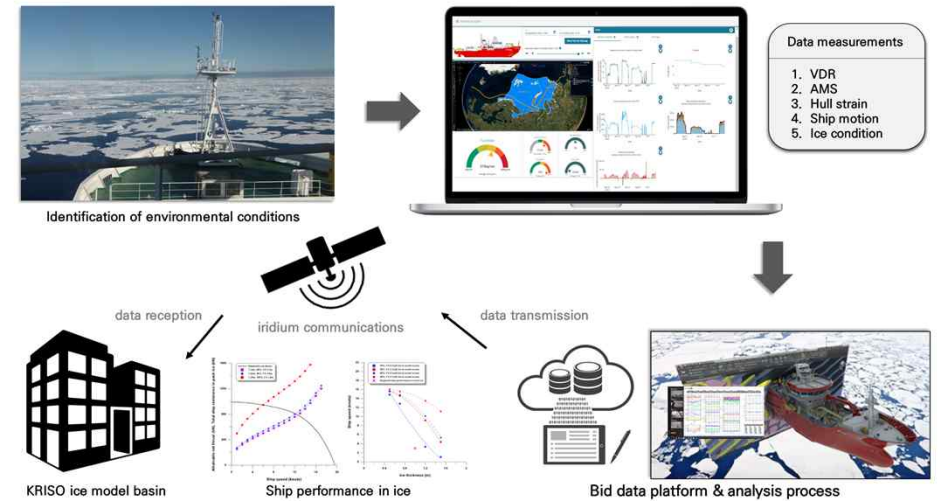

AI and Big Data : ICE

Image processing Technique based on AI algorithms

Ship Performance Monitoring System under Ice Conditions

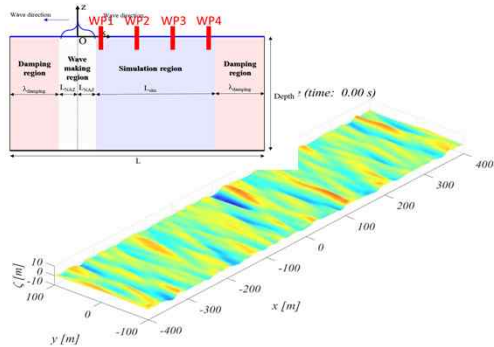

Virtual Ocean Engineering Basin based on High Fidelity CFD Simulation

Virtual Ocean Basin

• Ocean Environmental Conditions

- Irregular waves based on High Order Spectral Methods + CFD Coupling
- Realistic Wind/Current generation beyond Ocean Basin Scale

Global Performance Evaluation

• Motion stability & Maneuverability

- 3hr. Simulation of Model Scale Offshore Floaters
- Final Goal: Full-scale Simulation for Operation and Maintenance

Customization

• Motion stability & Maneuverability

- Minimization of the Numerical Dissipation for Wave Propagations

- Low Calculation Cost for Simulating Turbulent Flows at High Reynolds Number ($O(10^6)$), within $\pm 3.5\%$ Error

Only 3-5 millions cells to capture turbulent flows at high Re

Etc.

• Validation for High Fidelity Simulation

- Abundant Experimental Data from the KRISO's Ocean Engineering Basin

• Customized Grid Generation Program

(Collaborated with NEXTfoam)

- Cartesian Cut-Cell based Grid System Optimized for Offshore Platform

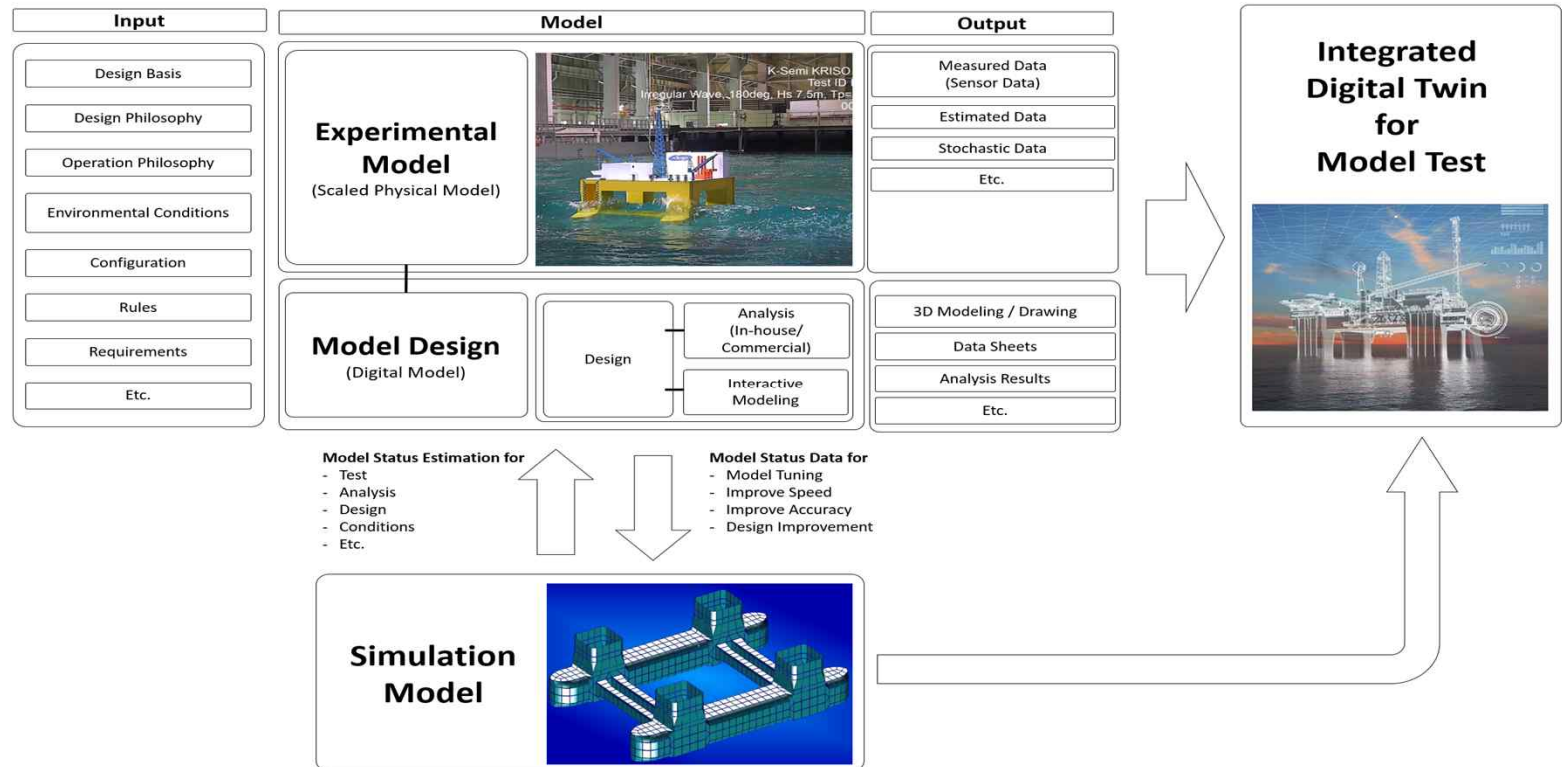

Digital Twin for Model Tests

*Concept Stage

Digital Twin For Model Tests

- Digital Twin based on the data from physical model test and simulation tool
- Digital Twin for model test can be accessed at any where, any time by authorized personals
- Provides an opportunity to observe the model test and review the results without visiting the basin e.g. at the time of COVID-19

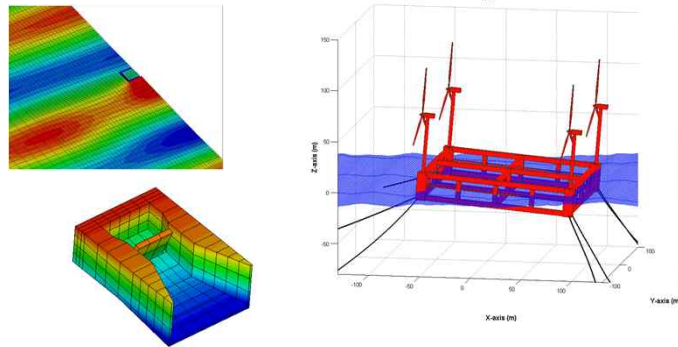

Simulation-based Design of Marine Renewable Energy

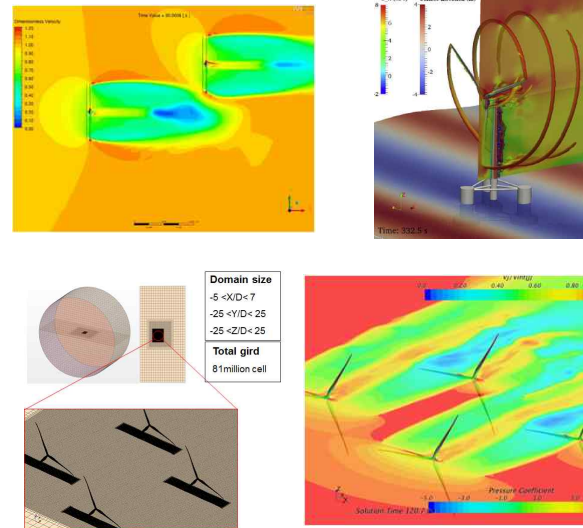

Potential Flow based Analysis

$$\begin{cases} \frac{\partial \phi}{\partial t} = -g\zeta & \text{on } z=0 \\ \frac{\partial \phi}{\partial z} = \frac{\partial \phi}{\partial z} & \text{on } z=0 \\ \nabla^2 \phi = 0 & \text{in } \Omega \end{cases}$$

$$\frac{\partial \phi}{\partial n} = 0 \quad \text{on } \Gamma_B$$

CFD Analysis for FOWT

CFD Application on WEC

Digital Twin for OWC Wave Energy Converter

Marine Renewable Energy & Digital Twin

Digital Twin of KRISO OWC Wave Energy Converter

CFD / FEA can be an alternative approach for design validation?

CFD Application in Offshore Engineering

Source : Frontenergies

Structural Digital Twin for Asset Management

Source : AKSELOS

Concluding Remarks

- “Digitalization in Marine hydrodynamics” is on-going expanding area and will be more essential.
- Can “Digitalization in Marine hydrodynamics” provide better design, performance and efficient solution to maritime industry ?
- Can “Digitalization in Marine hydrodynamics” contribute to the recent driving force for safe, autonomous, and zero emission technology in shipbuilding and offshore engineering?
- For ITTC aspects:
 Beyond the model test procedures, how can the guideline of “Digitalization in Marine hydrodynamics” be provided by?
 (standardization, reliability, accessibility, security, collaboration with IT professionals, etc.)
